Tristays Technologies Pvt Ltd · B2B AI travel-quoting platform for India's travel agents

Engineering Internship — 3 Openings

We are a small, fast-moving product company building the booking and intelligence platform for India's independent travel agents. We work AI-first: our engineers use AI tools every day and are expected to judge the output, not just paste it. You will work directly with the founder and ship real work used by real agents. We are hiring three interns, each owning a clear lane so the work never overlaps.

Internship terms (all three roles)

- Duration: 6 months, full-time.
- Stipend: ₹5,000 / month for the first 3 months, then ₹10,000 / month for the next 3 months.
- Pre-Placement Offer (PPO): strong performers are converted to a full-time role at ₹5,00,000 / year.
- Location: Thane / Mumbai (hybrid). Selection: a 2-part test, then a 30-minute live round.

Role 1 — Frontend Engineering Intern

You own the screen agents use every day to build and send quotes to their clients.

What you will do

- Build and fix screens in the live agent web app.
- Build new booking flows for hotels and flights, end to end on the interface side.
- Make large itineraries load and scroll smoothly.
- Keep the interface honest — it displays prices, it never invents them.

You must have

- Solid JavaScript, HTML and CSS fundamentals.
- At least one real interface you built and can explain and debug.
- An eye for how a screen should feel to use.
- The judgement to tell when AI-written code is wrong before it ships.

Nice to have

- React, any real project with live data, basic design sense.

You will learn (we train the stack)

- React patterns, working inside a live single-page app, and shipping to production without breaking it.

Role 2 — Backend Engineering Intern

You own the server-side logic and APIs behind the app — including the money math that has to be exactly right.

What you will do

- Build and fix the endpoints behind quoting, saving and billing.
- Integrate booking APIs for hotels and flights.
- Keep pricing and billing correct, safe and impossible to double-charge.
- Help move the data layer onto a proper database.

You must have

- Strong computer-science fundamentals.
- Comfortable writing Python.
- Understand HTTP and APIs, and basic SQL.
- The judgement to tell when AI-written code is wrong before it ships.

Nice to have

- Any REST API you have built or called, SQL, Git.

You will learn (we train the stack)

- API design, backend on Apps Script and Python, databases, and safe deploys to a live system.

Role 3 — Data, Pipeline & AI Integration Intern

You own the data that makes our quotes good, and you keep the AI layer honest.

What you will do

- Load hotel and activity inventory from supplier APIs into our system.
- Clean, de-duplicate and quality-check large datasets so nothing wrong reaches a live quote.
- Wire up and evaluate the AI enrichment step — which classifies and enriches data but must never invent a price or a tour.
- Build small scripts that remove repetitive manual work.

You must have

- Comfortable writing Python.
- Basic SQL and a careful eye for wrong data.
- Patience with large messy datasets and the discipline to verify, not assume.
- The judgement to catch when the AI has made something up — this is the core of the job.

Nice to have

- pandas, experience calling APIs, any data-cleaning or AI project.

You will learn (we train the stack)

- Data pipelines, ingestion and QA, evaluating AI output, and how a real system keeps AI from lying into production.

How to apply

Send your CV and a link to one project you are proud of, and state clearly which role you are applying for (you may apply for more than one). Shortlisted candidates sit a two-part test — a written fundamentals paper, then an open-book, AI-allowed engineering round — followed by a 30-minute conversation.
